

Interpreting Log Error

James Chen

March 5, 2018

Let \hat{P} be an estimate of the target value P . Say in the training we have obtained

$$\log(1 + P) = \log(1 + \hat{P}) \pm \hat{\epsilon} \quad (1)$$

where $\hat{\epsilon}$ is some estimate ¹ of the test error and

$$\hat{\epsilon} \ll 1 \ll \hat{P}, \quad (2)$$

then

$$P \approx \hat{P}(1 \pm \hat{\epsilon}), \quad \hat{P} \approx P(1 \pm \hat{\epsilon}). \quad (3)$$

In other words, the error $\hat{\epsilon}$ for $\log(1 + \hat{P})$ translates ² to the percentage-error $100\hat{\epsilon} \%$ for \hat{P} .

Proof. From (1), we have $\log[(1 + P)/(1 + \hat{P})] = \pm \hat{\epsilon}$, that is,

$$P = -1 + e^{\pm \hat{\epsilon}}(1 + \hat{P}) \quad (4)$$

Since $\hat{\epsilon}$ is relatively small, e.g. $\hat{\epsilon} \approx 0.01$ (see (2)), by Taylor series,

$$e^{\pm \hat{\epsilon}} \approx 1 \pm \hat{\epsilon} \quad (5)$$

Substitue (5) into (4), we have

$$\begin{aligned} P &\approx \hat{P} \pm \hat{\epsilon} \hat{P} \pm \hat{\epsilon} \\ &\approx \hat{P}(1 \pm \hat{\epsilon}) \end{aligned} \quad (6)$$

Notice that in the last step leading to (6), we drop the term $\pm \epsilon$ since $\epsilon \ll \hat{P}$ and $\epsilon \ll \hat{\epsilon} \hat{P}$ (see (2)). This proves the first approximation in (3).

Next, from (6), we estimate that

$$\hat{P} \approx P(1 \pm \hat{\epsilon}), \quad (7)$$

which can be derived by substituting the following two approximations into (6):

$$\begin{aligned} \frac{1}{1 - \hat{\epsilon}} &= 1 + \hat{\epsilon} + \hat{\epsilon}^2 + \hat{\epsilon}^3 + \dots \approx 1 + \hat{\epsilon}, \\ \frac{1}{1 + \hat{\epsilon}} &= 1 - \hat{\epsilon} + \hat{\epsilon}^2 - \hat{\epsilon}^3 + \dots \approx 1 - \hat{\epsilon}. \end{aligned}$$

This proves the second approximation in (3). □

¹For example, we may take $\hat{\epsilon}$ to be the worst (largest) root mean square error from cross validations.

²By the way, (3) also hold for the case when $\log P = \pm \hat{\epsilon} + \log \hat{P}$ under the same assumption (2). The proof is similar.
